

Evolution and Selection of Quantitative Traits

B. Walsh and M. Lynch

Draft version 30 April 2010

Contents for Chapters Covered in Wageningen University Course, June 2010

CONTENTS	i
7. THE POPULATION GENETICS OF SELECTION	201
Single-locus Selection: Two Alleles	202
Viability Selection	202
Expected time for allele frequency change	204
Complications: Differential Viability Selection on the Sexes	205
Complications: Frequency-dependent Selection	206
Complications: Fertility Selection	206
Complications: Sexual Selection	206
Wright's Formula	207
Adaptive topographies and Wright's formula	210
Single-locus Selection: Multiple Alleles	211
Marginal fitnesses and average excesses	211
Changes in genotypic fitnesses, W_{ij}	211
Changes in mean fitness and equilibrium values	212
Internal, corner, and edge equilibrium; Basins of attraction	213
Dynamics of response under viability and fertility selection	214
Wright's Formula With Multiple Alleles	215
Selection on Two Loci	217
Dynamics of gamete frequency change	217
Gametic equilibrium values, linkage disequilibrium, and mean fitness	219
Particular fitness models	220
Phenotypic stabilizing selection and the maintenance of genetic variation	221
Theorems of Natural Selection: Fundamental and Otherwise	225
The classical interpretation of Fisher's fundamental theorem	225
What did Fisher really mean?	228
Mean fitness, Wright's adaptive topography, and Fisher's fundamental theorem	229
Heritability values for characters correlated with fitness	229
Non-additive genetic variances and traits under selection	232
Robertson's Secondary Theorem of Natural Selection	233
The secondary theorem under arbitrary epistasis	235
Selection on a Quantitative Trait Locus	237
A single gene underlies the character	237
Many loci of small effect underlying the character	238
A population-genetics derivation of the breeders' equation	240
Correct quadratic terms for s_i	241
10. SHORT-TERM CHANGES IN THE MEAN:	
1. THE BREEDERS' EQUATION	101

ii CONTENTS

Single-generation Response: The Breeders' Equation	102
Response is the Change in Mean Breeding Value	102
The importance of linearity	103
Response under More General Parent-offspring Regressions	104
The Selection Intensity	106
The Robertson-Price Identity, $S = \sigma(w, z)$	106
Correcting for Reproductive Differences: Effective Selection Differentials	107
Expanding the Basic Breeders' Equation	108
Accuracy	108
Reducing Environmental Noise: Stratified Mass Selection	111
Reducing Environmental Noise: Repeated-measures Selection	112
Adjustments for Non-overlapping Generations	114
Maximizing Response Under the Breeders' Equation	115
Maximizing the Economic Rate of Response	116
Prelude to the multivariate breeders' equation	117
Truncation Selection	119
Selection intensities and differentials under truncation selection	119
Correcting the selection intensity for finite samples	120
Response in Discrete Traits: Binary Traits	123
The Threshold/Liability model	124
Logistic Regressions and the Logistic Distribution	127
Direct Selection on the Threshold T	129
Response in Discrete Traits: Poission-distributed Characters	131
Summary: Limitations of the Breeders' Equation	133
11. SHORT-TERM CHANGES IN THE MEAN:	
2. PERMANENT VERSUS TRANSIENT RESPONSE	139
Permanent Versus Transient Response	139
Response with epistasis	140
Selection on autotetraploids	143
Ancestral Regressions	144
Response due to Environmental Correlations	147
Maternal Effects	149
Response Under Falconer's Dilution Model	150
Other Models of Maternal Effects	155
13. SHORT-TERM CHANGES IN THE VARIANCE	179
Changes in Variance Due to Linkage Disequilibrium	179
Changes in Variance Under the Infinitesimal Model	181
Within- and between-family variance under the infinitesimal model	183
Accounting for inbreeding and drift	185
Change in Variance Under Truncation Selection	185
Changes in correlated traits	187
Directional Truncation Selection: Theory	188
Directional Truncation Selection: Experimental results	190
Effects of epistasis: Does the Griffing effect overpower the Bulmer effect?	190
Double Truncation Selection: Theory	191
Double Truncation Selection: Experimental Results	194
Response under Normalizing Selection	195
Selection with Assortative Mating	196

Results using the infinitesimal model	196
Assortative mating and enhanced response	197
Disruptive selection, assortative mating, and reproductive isolation	199
Selection in the Presence of Heritable Variation in σ_E^2	199
Micro-environmental variance, developmental noise and canalization	200
Evidence for heritable variation in the environmental variance	201
Modeling genetic variation in σ_E^2	202
h_v^2 , the heritability of the environmental variance	205
Translating the response in A_v into response in σ_E^2	206
Selection response in σ_E^2	207
24. THE INFINITESIMAL MODEL AND ITS EXTENSIONS	100
The Infinitesimal Model	101
Allele frequencies do not change under the infinitesimal model	101
Disequilibrium under the infinitesimal model	102
Dominance	102
Gaussian features of the infinitesimal	103
Not all limits are Gaussian	103
Modifications of the infinitesimal model	104
Gaussian Continuum-Of-Alleles Models	104
Infinite alleles and continuum-of-alleles models	104
Drift	105
Drift and a finite number of loci	107
Effective number of loci, n_e	108
Dynamics: σ_a^2 and d change on different time scales	109
Response in stabilizing selection experiments: selection or drift?	110
How robust is the continuum-of-alleles model?	110
The Bulmer Effect Under Linkage	111
An approximate treatment	111
A more careful treatment	114
Response Under Non-Gaussian Distributions	116
Describing the genotypic distribution: Moments	116
Describing the genotypic distribution: Cumulants and Gram-Charlier series	119
Application: Departure from normality under truncation selection	121
Short-term response ignoring linkage disequilibrium	124
Short-term response ignoring allele frequency change	128
Summary: Where Does All This Modeling Leave Us?	130
25. LONG-TERM RESPONSE: DETERMINISTIC ASPECTS	134
Idealized Long-term Response in a Large Population	258
Deterministic Single-locus Theory	261
Lande's model: a major gene in an infinitesimal background	266
Are major genes or polygenes more important for long-term response?	269
An Overview of Long-term Selection Experiments	271
Estimating selection limits and half-lives	271
General features of long-term selection experiments	272
Increases in variances and accelerated responses	275
Linkage effects	278
Conflicts Between Natural and Artificial Selection	281
Accumulation of lethals in selected lines	283

Expected equilibrium frequency of recessive lethals	283
Lerner's model of genetic homeostasis	287
Characterizing the Nature of Selection Limits	288
26. LONG-TERM RESPONSE: FINITE POPULATIONS	291
Population Genetics of Selection and Drift	292
Drift and selection at a single locus	292
Fixation probabilities for alleles at QTL	295
Expected allele frequency in a particular generation	296
The Cohan effect: increased divergence under uniform selection	297
Results for two loci: the Hill-Robertson effect	299
The Effect of Selection on Effective Population Size	302
The expected reduction in N_e from directional selection	303
Molecular variation is reduced in regions of low recombination	307
Drift and Long-term Selection Response	308
Basic theory	309
Robertson's theory of selection limits	311
Tests of Robertson's theory of selection limits	313
Weber's selection experiments on <i>Drosophila</i> flight speed	317
The Effects of Linkage on the Selection Limit	319
Optimal Selection Intensities for Maximizing Long-term Response	323
Effects of Population Structure on Long-Term Response	326
Founder effects and population bottlenecks	326
Population subdivision	330
Within-family selection	333
Asymptotic Response due to Mutational Input	335
Results for the infinitesimal model	336
Expected asymptotic response under more general conditions	339
Optimizing Asymptotic Selection Response	342
VII. MEASURING SELECTION	3
28. INDIVIDUAL FITNESS AND THE MEASUREMENT OF UNIVARIATE SELECTION	301
Episodes of Selection and the Assignment of Fitness	301
Fitness components	302
Assigning fitness components	303
Potential issues with assigning discrete fitness values	305
Assigning components of offspring fitness to their mothers	305
Concurrent episodes, reproductive timing and individual fitness λ_{ind}	307
Variance in Individual Fitness	310
Partitioning I across episodes of selection	312
Correcting lifetime reproductive success for random offspring mortality	313
Variance in mating success: Bateman's principles	314
Some caveats in using opportunity of selection	314
Descriptions of Phenotypic Selection: Introductory Remarks	316
Fitness surfaces	317
Descriptions of Phenotypic Selection: Changes in Phenotypic Moments	319
Directional selection	319

Quadratic selection	319
Gradients describe the local geometry of the fitness surface	321
Gradients appear in selection response equations	321
Partitioning changes in means and variances into episodes of selection	322
Choice of the reference population: “ independent partitioning”	323
Standard errors for estimates of differentials and gradients	324
Descriptions of Phenotypic Selection: Individual Fitness Surfaces	325
Linear and quadratic approximations of $W(z)$	326
Hypothesis testing and approximate confidence intervals	329
Power	331
Quadratic surfaces can be very misleading	331
Fitting other parametric fitness functions	332
Nonparametric approaches: Schluter’s cubic-spline estimate	333
The importance of experimental manipulation	334
29. MEASURING MULTIVARIATE SELECTION	370
Selection on Multivariate Phenotypes: Differentials and Gradients	370
Changes in the mean vector: the directional selection differential \mathbf{S}	371
The directional selection gradient β	372
Directional gradients, fitness surface geometry and selection response	374
Changes in the covariance matrix: the quadratic selection differential \mathbf{C}	375
The quadratic selection gradient γ	376
Quadratic gradients, fitness surface geometry and selection response	378
Fitness surface curvature and within-generation changes in variances and covariances	379
Multivariate Quadratic Fitness Regressions	380
Estimation, hypothesis testing and confidence intervals	380
Regression packages and coefficients of γ	382
Geometric aspects	382
A brief digression: orthonormal and diagonalized matrices	383
Canonical transformation of γ	384
Are traits based on canonical axes “real”?	387
Strength of selection: γ_{ii} versus λ	388
Significance and confidence regions for a stationary point	388
Multivariate Nonparametric Fitness Surface Estimation	389
Projection pursuit regression	389
Thin-plate splines	390
Strength of Selection in Natural Populations	391
Kingsolver’s meta-analysis	392
Directional selection: strong or weak?	393
Quadratic selection: strong or weak?	396
Directional selection on body size and Cope’s law	397
Unmeasured Characters and Other Biological Caveats	397
Path Analysis and Fitness Estimation	399
 VIII. SELECTION ON MULTIPLE CHARACTERS	 3
 30. MULTIVARIATE RESPONSE: CHANGES IN MEANS	 1
The Multivariate Breeders Equation	1

Overview of key features and concepts	1
Derivation of the multivariate breeders equation	4
The multivariate secondary theorem of natural selection	7
Response when the parent-offspring regression is multivariate linear	8
Bivariate Selection	9
Correlated response to selection	10
Indirect selection may give a larger response than direct selection	12
Realized genetic correlations	13
General bivariate selection	15
Realized genetic correlations with bivariate selection	17
Asymmetric correlated responses are frequently seen	18
Comparison of Multivariate Responses	18
Standardization of response	19
Mean standardization and evolvability	21
Realized selection gradients	21
Evolutionary Constraints Imposed by Genetic Correlations	25
Dynamics of quantitative traits on an adaptive topography	26
What happens to mean fitness \bar{W} ?	27
Constraints are given by the eigenstructure of \mathbf{G}	27
Trade-offs, developmental constraints, genetic correlations, and the Lande equation	30
Multivariate measures of evolvability	32
Schluter's genetic line of least resistance, \mathbf{g}_{\max}	33
Is there genetic variation in the direction of response?	36
Blow's matrix subspace projection	37
Conditional genetic variance and conditional evolvability	39
31. MULTIVARIATE RESPONSE: CHANGES IN COVARIANCES	1
Changes in \mathbf{G} Under the Infinitesimal Model	1
The dynamics of the disequilibrium matrix \mathbf{D}	2
The proportional change model for $\Delta\mathbf{P}$	3
Within-generation changes \mathbf{G} due to selection on variances and covariances	5
Asymmetric correlated responses occurs under the infinitesimal model	6
Response in \mathbf{G} under a multivariate Gaussian fitness function	8
Allele Frequency Changes and Instability of Genetic Covariances	11
Pleiotropic-based genetic correlations may become more negative over time	12
Genetic covariances are more fragile than genetic variances	12
It is difficult for antagonistic pleiotropy to maintain variation	13
Hidden Pleiotropy: A zero genetic covariance can still harbor many pleiotropic alleles	15
Experimental Studies of the Response to Selection to Change Covariances	16
Genetic Models of Covariances	19
Resource partitioning models: background	19
James' analysis of changes in covariances under resource partitioning models	19
Tradeoffs can lead to positive, as well as negative, covariances	21
Björklund's analysis	22
Optimization models, Functional Constraints, and \mathbf{G}	23
Long-Term Directional Selection	26
The infinitesimal model with drift	27
The infinitesimal model with drift and mutation	28
The balance between directional and stabilizing selection: infinitesimal model results	29
Long-term response is a function of the distribution of allelic effects	30

The balance between directional and stabilizing selection: Finite locus models	31
Long-term Quadratic Selection	32
Lande’s multivariate model of pleiotropic mutation-selection balance	33
γ and \mathbf{G}	34
Model assumptions, genetic correlations, and hidden pleiotropy	35
Stability of \mathbf{G}	36
32. COMPARISONS OF \mathbf{G} AND ITS STABILITY	1
Changes in \mathbf{G} Under Drift	1
Under additivity, \mathbf{G} shows an expected proportional decrease	1
The experimental results of Phillips, Whitlock, and Fowler	2
Changes in \mathbf{G} when non-additive genetic variance is present	5
The eigenstructure of \mathbf{G} under drift and mutation	6
Comparing Covariance Matrices: Methodology	7
General issues of inference on \mathbf{G} using a population sample	8
Identity, proportionality, common orientation, common scaling	9
Element-by-element tests	11
Roff’s jackknife MANOVA approach	12
Roff’s T test	13
Mantel’s test and other matrix correlation approaches	14
Regression methods: tests of proportionality	15
Likelihood-based tests assuming multivariate normality: variance components	16
Likelihood-based tests assuming multivariate normality: Bertlett’s modified test	17
Random skewers: probing the geometry of \mathbf{G} with responses to selection response	18
Comparison of shared geometry: the Flury hierarchy	19
Comparison of shared geometry: Krzanowski subspace comparison	24
Still no ideal solution	25
Comparing Covariance Matrices: Data	25
Conclusions	28
Estimating the Dimension of a Covariance Matrix	28
Leading eigenvalues are overestimated, smaller eigenvalues underestimated	29
Problems with bootstrap-based confidence intervals for eigenvalues and rank	30
Canonical decomposition of the estimated covariance matrix	32
Amemiya’s rank test	33
Reduced Rank estimates of \mathbf{G}	34
Factor-analytic approaches for building reduced-rank estimates	35
Dimensionality of \mathbf{G} : data	37
Eigenvalue-based measures of effective dimensionality	38
33. THEORY OF INDEX SELECTION	400
General Theory Selection on a Linear Index	400
Genetic variance, heritability, and response of an index	400
Response in the individual components of the index	402
The retrospective index	403
The selection and response indices may contain different traits	404
Changes in the additive variance of I due to index selection	405
Changes in \mathbf{G} and \mathbf{P} under index selection	406
Optimizing the Expected Response of a Linear Index	408
The index of selection usually does not equal the index of response	408
Selection and response indices with non-overlapping traits	409

The Smith-Hazel index	411
Properties of the Smith-Hazel Index	412
Other useful results for the Smith-Hazel index	414
Estimated, base, and Elston indices	414
The Hayes-Hill transformation: detecting flaws in the estimated index	418
“Bending” and “rounding” corrections of the estimated index	419
Constraints on \mathbf{R} and \mathbf{S} given a specified selection intensity	420
Restricted and Desired-gains Indices	421
Restricted indices	421
Desired-gains indices	423
Summary of Linear Selection Indices	426
Nonlinear Selection Indices	427
Specific issues with nonlinear indices	427
Quadratic indices	428
Linear indices for nonlinear merit	431
Exact optimization of nonlinear indices	433
Optimal weights depend on the length of the experiment	433
Sequential Approaches: Tandem Selection and Independent Culling	434
Tandem selection	434
Independent culling	435
Selection of extremes	437
Relative Efficiencies of Index Selection, Independent Culling, and Tandem Selection	438
Theory	438
Data	440
Multistage Selection	441
Optimal values for multistage cullings	441
Cotterill and James’ approximately optimal two-stage selection	442
Multistage index selection	443
Xu and Muir’s method of transformed culling and orthogonal index selection	443
34. SOME APPLICATIONS OF INDEX AND MULTIPLE-TRAIT SELECTION	455
Improving the Response of a Single Character Using a Selection Index	455
General theory	456
More detailed analysis of two special cases	458
Repeated measures of a character	460
Using Information From Relatives	461
General Theory	461
Information from a single relative	462
Constructing selection indices when the individual itself is not measured	463
Within and Between Family Selection	465
Lush’s index	466
Osborne’s index	470
Selection on a Ratio	471
Approximate linear indices for ratio selection	472
Other linear-based indices for ratio selection	474
Which method is best?	474
Selection directly on a ratio: selection differentials and response	475
Selection and Sexual Dimorphic Traits	479

Components of the genotype \times sex interaction variance	480
Selection in sex-limited traits	480
Differential selection across the sexes	480
Sex-specific transmission differences	481
The joint response for a single dimorphic trait	481
Response with sex-linkage	485
Sexual dimorphism: a correlated or direct response?	486
Sexual dimorphism in size: Rensch's rule	487
Selection on a vector of sexually dimorphic traits	488
Selection of the Environmental Variance σ_E^2	490
The bivariate Mulder-Bijima-Hill Model: Estimation	490
The bivariate Mulder-Bijima-Hill Model: Response in σ_E^2	490
Extensions of the Mulder-Bijima-Hill Model: Accounting for skew	490
Extensions of the Mulder-Bijima-Hill Model: Family and Sire-selection	490
Changes in the genetic variances and covariance for A_m, A_v	490
A2. INTRODUCTION TO BAYESIAN STATISTICS	21
Bayes' theorem	21
From Likelihood to Bayesian Analysis	23
Marginal Posterior Distributions	24
Summarizing the Posterior Distribution	24
Highest Density Regions (HDRs)	25
Bayes Factors and Hypothesis Testing	25
The Choice of a Prior	27
Diffuse Priors	28
Sufficient Statistics and Data-transformed likelihoods	28
The Jeffreys' Prior	29
Posterior Distributions Under Normality Assumptions	31
Known Variance and Unknown Mean	31
Gamma, Inverse-Gamma, χ^2 and χ^{-2} distributions	33
Unknown Variance, Inverse- χ^2 priors	34
General case: unknown mean and variance	35
Conjugate Priors	35
The Beta and Dirichlet Distributions	36
Wishart and Inverse-Wishart Distributions	36
Conjugate Priors for the Exponential Family of Distributions	37
A3. MCMC METHODS AND BAYESIAN ANALYSIS	39
Monte Carlo Integration	39
Importance Sampling	40
Introduction to Markov Chains	40
The Metropolis-Hastings Algorithm	43
Metropolis-Hastings Sampling as a Markov Chain	45
Burning-in the Sampler	46
Simulated Annealing	47
Choosing a Jumping (Proposal) Distribution	48
Convergence Diagnostics	49
Autocorrelation and Sample Size Inflation	49
Tests for Convergence	50
One Long Chain or Many Smaller Chains?	51

The Gibbs Sampler	51
Using the Gibbs Sampler to Approximate Marginal Distributions	53
The Monte Carlo Variance of a Gibbs-Sampled Based Estimate	54
Convergence Diagnostics: The Gibbs Sampler	55
A4. THE GEOMETRY OF VECTORS AND MATRICES:	
EIGENVALUES AND EIGENVECTORS	59
The Geometry of Vectors and Matrices	59
Comparing vectors: lengths and angles	59
Matrices describe vector transformations	61
Orthonormal matrices	62
Eigenvalues and eigenvectors	63
Properties of symmetric matrices	65
Correlations can be removed by a matrix transformation	67
Canonical axes of quadratic forms	68
Implications for the multivariate normal distribution	70
Principal components of the variance-covariance matrix	71
Testing for Multivariate Normality	73
Graphical tests: Chi-square plots	73
Mardina’s test: Multivariate skewness and kurtosis	75
A5. DERIVATIVES OF VECTORS AND VECTOR-VALUED FUNCTIONS	79
Derivatives of Vectors and Vector-valued Functions	79
The hessian matrix, local maxima/minima, and	
multidimensional Taylor series	83
Optimization under constraints	86
