

Evolution and Selection of Quantitative Traits

I: Foundations

B. Walsh and M. Lynch

Draft version 19 September 2011

CONTENTS	i
PREFACE	xiii
ROADMAP: DIFFERENT PATHS THROUGH THE BOOK	xiii
I. INTRODUCTION	1
1. CHANGES IN QUANTITATIVE TRAITS OVER TIME	1
II. EVOLUTION AT ONE AND TWO LOCI	1
2. <i>NEUTRAL EVOLUTION IN ONE- AND TWO-LOCUS SYSTEMS</i>	<i>1</i>
The Wright-Fisher Model	2
Loss of Heterozygosity by Random Genetic Drift	5
Probabilities and Times to Fixation or Loss	7
Allele-frequency Divergence Among Populations	9
Higher-order Allele-frequency Moments	11
Linkage Disequilibrium	13
Mutation-Drift Equilibrium	14
The Genealogical Structure of a Population	17
3. <i>THE GENETIC EFFECTIVE SIZE OF A POPULATION</i>	
General Considerations	1
Monoecy	3
Dioecy	6
Age Structure	8
Variable Population Size	11
Partial Inbreeding	12
Special Systems of Mating	13
Population Subdivision	16
Selection, Recombination, and Hitch-hiking Effects	18
4. <i>THE NONADAPTIVE FORCES OF EVOLUTION</i>	
Relative Power of Mutation and Genetic Drift	2
Nucleotide diversity	2
Number of segregating sites	4
Alternative approaches	5
Empirical observations	5
Relative Power of Recombination and Genetic Drift	6

ii **CONTENTS**

Number of recombinational events in a sample	7
Other approaches	9
Emperical observations	10
Effective Population Size	11
Emperical observations	14
Mutation Rate	14
Divergence analysis	15
Short-term enrichment	16
Emperical observations	18
Recombination Rate	20
General Implications	22
5. CHANGES IN GENETIC VARIANCE INDUCED	
BY RANDOM GENETIC DRIFT	1
Response of Within-population Genetic variance to Drift	2
The effects of dominance	3
The effects of epistasis	8
Sampling error	11
Empirical data	14
Covariance Between Inbred Relatives	18
Empirical observations	22
Drift-Mutation Equilibrium	24
Subdivided populations	27
6. THE NEUTRAL DIVERGENCE OF QUANTITATIVE TRAITS	1
Short-term divergence	1
Sampling error	3
Empirical observations	5
Long-term Divergence	6
Effectively neutral divergence and the estimation of rates of mutational variance ...	8
Testing the Null Hypothesis of Neutral Phenotypic Divergence	10
Long-term drift of mean phenotypes among isolated species	10
Population subdivision for quantitative traits	13
QTL analysis of divergence lines	15
7. THE POPULATION GENETICS OF SELECTION	201
Single-locus Selection: Two Alleles	202
Viability Selection	202
Expected time for allele frequency change	204
Complications: Differential Viability Selection on the Sexes	205
Complications: Frequency-dependent Selection	206
Complications: Fertilty Selection	206
Complications: Sexual Selection	206
Wright's Formula	207
Adapative topographies and Wright's formula	210
Single-locus Selection: Multiple Alleles	211
Marginal fitnesses and average excesses	211
Changes in genotypic fitnesses, W_{ij}	211
Changes in mean fitness and equilibrium values	212
Internal, corner, and edge equilibrium; Basins of attraction	213

Dynamics of response under viability and fertility selection 214

Wright’s Formula With Multiple Alleles 215

Selection on Two Loci 217

 Dynamics of gamete frequency change 217

 Gametic equilibrium values, linkage disequilibrium, and mean fitness 219

 Particular fitness models 220

 Phenotypic stabilizing selection and the maintenance of genetic variation 221

Theorems of Natural Selection: Fundamental and Otherwise 225

 The classical interpretation of Fishers’ fundamental theorem 225

 What did Fisher really mean? 228

 Mean fitness, Wright’s adaptive topography, and Fisher’s
 fundamental theorem 229

 Heritability values for characters correlated with fitness 229

 Non-additive genetic variances and traits under selection 232

Robertson’s Secondary Theorem of Natural Selection 233

 The secondary theorem under arbitrary epistasis 235

Selection on a Quantitative Trait Locus 237

 A single gene underlies the character 237

 Many loci of small effect underlying the character 238

 A population-genetics derivation of the breeders’ equation 240

 Correct quadratic terms for s_i 241

8. INTERACTION OF SELECTION, MUTATION, AND DRIFT 1

Selection and Mutation at a Single Locus 2

Selection and Drift at a Single Locus 5

 Probability of fixation under additive selection 6

 Probability of fixation under arbitrary selection 8

 Expected allele frequency in a particular generation 10

 Fixation of overdominant and underdominant alleles 11

 Divergence between populations 14

 Selection on quantitative-trait loci 15

Joint Interaction of Selection, Drift, and Mutation 17

Haldane’s Principle and the Mutational Load 18

Fixation Issues Involving Two Loci 21

 The Hill-Robertson Effect 21

 Compensatory Mutations 22

The Evolution of Genetic Machinery 25

 Evolutionary modification of the mutation rate 26

 Selection for recombination-rate modifiers 27

Mutation-selection balance at a diallelic locus 249

 Selection and mutation: Multiple alleles 251

 Haldane’s principal and genetic loads 251

Selection and Drift 252

 Drift and selection at a single locus 253

 Fixation probabilities for alleles at QTL 257

 Selection can speed fixation of overdominant alleles relative to drift 260

 The Cohan effect: increased divergence under uniform selection 260

 Results for two loci: the Hill-Robertson effect 261

 Molecular variation is reduced in regions of low recombination 264

Mutation and Drift 265

iv CONTENTS

Within-population variation	265
Age of an allele	267
The Joint Interactions of Selection, Drift, and Mutation	270
Kimura’s Neutral Theory of Molecular Evolution	271

9. USING MOLECULAR DATA TO DETECT SELECTION: OVERVIEW

General Introduction	101
Negative and Positive Selection	101
Time scales: Past vs. present selection	102
Markers, candidate genes, and genomic scans	103
Molecular Signatures of Selection	104
Ongoing directional selection creates excessive allele frequency divergence	104
Selection changes N_e , the TMRCA, and the genealogical topography at linked sites	106
Selective sweeps can leave a characteristic signal of decreased polymorphism	107
Selection changes the allele/site frequency spectrum	109
Ongoing selection decreases the age of common alleles	110
A history of selection alters the ratio of polymorphic to divergent sites	112
A history of (positive) selection alters the silent to replacement substitution rates	112
Summary: Searching for Selection	114
Final thoughts: Caution is in order when declaring positive selection!	115

**10. USING MOLECULAR DATA TO DETECT SELECTION:
SIGNATURES FROM RECENT SINGLE EVENTS**

Tests Based on Allele Frequency Change	122
Allele frequency change over two sample points: The Waples Adjusted test	123
Allele frequency change over a time series: The Fisher-Ford test	125
Allele frequency change: Multiple loci and genomic scans	128
Allelic divergence between two populations	129
F_{st} -based Tests	130
Population Structure, F_{ST} , and R_{ST}	130
The Lewontin-Krakauer test	133
Outlier approaches	134
Simulating demography and population structure	135
Parametric models	135
Branch length models	136
Fundamentals of Selective Sweeps	137
Hitchhiking, linkage drag, and selective sweeps	137
Hard versus soft sweeps	138
Behavior of neutral locus linked to a selected site: Allele frequency change	139
Background: The infinite alleles and infinite sites models	142
Behavior of neutral locus linked to a selected site: Reduction in genetic diversity	144
Background: The site frequency spectrum	147
Behavior of neutral locus linked to a selected site: The site frequency spectrum	148
Behavior of neutral locus linked to a selected site: Linkage disequilibrium	150
Age of sweep	152
Geographic structure	153
Summary: Signatures of a hard sweep	153
Detecting Hard Sweeps	154
Using microsatellite variation	155
Tests of sweeps using bottleneck models	157

Tests of sweeps using genomic spatial information: CLRT-GOF	158
Tests of sweeps using genomic spatial information: "SweepFinder"	160
Tests of sweeps using genomic spatial information: XP-CLR	162
Ascertainment issues	163
Model fragility: Demography, mutation, recombination, and gene conversion	164
Soft Sweeps and Polygenic Adaption	164
Sweeps using standing variation	165
How likely is a sweep using standing variation?	166
Recurrent mutation of the favorable allele cannot be ignored	168
Signatures of a soft sweep	172
Polygenic sweeps	172
Tests Based on the Site Frequency Spectrum	173
Summary statistics based on infinite sites models	174
Tajima's D	176
Fu and Li's D^* and F^* tests	178
Fay and Wu's H test	178
Zeng et al's E test	179
Accounting for demography when assessing the significance of a test	180
Support via a preponderance of evidence	182
Caveats: SNP ascertainment bias	182
Caveats: Recombination makes most tests conservative	183
Haplotype-based tests	183
Defining and inferring haplotypes	185
The infinite alleles frequency spectrum and the Ewens-Watterson test	185
Other infinite-alleles tests: Conditioning in $\hat{\theta}$	187
Other infinite-alleles tests: Conditioning in S	188
Pairwise disequilibrium tests: Kelly's Z_{nS} and Kim and Nielsen's ω_{max}	190
Contrasting frequency and intra-allelic estimates of haplotype age	191
Long haplotype tests	194
Summary: LD-based tests of selection	197
Searches for selection in humans and domesticated organisms	199
Recent/current selection in humans	199
Domestication versus improvement genes	201
Finding domestication and improvement genes in crops	201
Fruit flies and Silkworms	204
Constraints on finding domestication/improvement genes through selective signals	205
Relative strengths of selection on domestication versus improvement genes	206

11. USING MOLECULAR DATA TO DETECT SELECTION:

SIGNATURES FROM MULTIPLE HISTORICAL EVENTS

Population-based Divergence Tests	222
The Hudson-Kreitman-Aguadé (HKA) test	223
The McDonald-Kreitman (MK) test: Basics	226
The McDonald-Kreitman test: Caveats	230
Dominance and the MK test	234
Recombinational bias in extended MK tests	234
Estimating Parameters of Adaptive Evolution	234
Estimating the fraction α of substitutions that are adaptive	235
How common are adaptive substitutions?	238

Estimating the rate λ of adaptive substitutions	240
The Sawyer-Hartl Poisson Random Fields Model: Basics	241
The Sawyer-Hartl Poisson Random Fields Model: Bayesian extensions	246
Genome-Wide Impact of Repeated Selection at Linked Sites	248
Effects of recurrent selective sweeps	248
A few large or many small sweeps?	250
Background selection: Reduction in variation under low recombination or selfing	253
Background selection vs. recurrent selective sweeps	255
Sweeps, background selection, and substitution rates	256
Sweeps, background selection, and codon usage bias	258
A paradigm shift away from the neutral theory	262
Phylogeny-based Divergence Tests	263
The K_A to K_S ratio ω	264
Parsimony-Based ancestral reconstruction tests	265
Maximum-Likelihood-Based codon tests	266
Bayesian estimators of sites under positive selection	269
Connecting the parameters of adaptive evolution	272
Closing Comments	272
Curbing Enthusiasm	273

III. SHORT-TERM RESPONSE ON A SINGLE CHARACTER 100

12. SHORT-TERM CHANGES IN THE MEAN:

1. THE BREEDERS' EQUATION	101
Single-generation Response: The Breeders' Equation	102
Response is the Change in Mean Breeding Value	102
The importance of linearity	103
Response under More General Parent-offspring Regressions	104
The Selection Intensity	106
The Robertson-Price Identity, $S = \sigma(w, z)$	106
Correcting for Reproductive Differences: Effective Selection Differentials	107
Expanding the Basic Breeders' Equation	108
Accuracy	108
Reducing Environmental Noise: Stratified Mass Selection	111
Reducing Environmental Noise: Repeated-measures Selection	112
Adjustments for Non-overlapping Generations	114
Maximizing Response Under the Breeders' Equation	115
Maximizing the Economic Rate of Response	116
Prelude to the multivariate breeders' equation	117
Truncation Selection	119
Selection intensities and differentials under truncation selection	119
Correcting the selection intensity for finite samples	120
Response in Discrete Traits: Binary Traits	123
The Threshold/Liability model	124
Logistic Regressions and the Logistic Distribution	127
Direct Selection on the Threshold T	129
Response in Discrete Traits: Poisson-distributed Characters	131
Summary: Limitations of the Breeders' Equation	133

13. SHORT-TERM CHANGES IN THE MEAN:	
2. PERMANENT VERSUS TRANSIENT RESPONSE	139
Permanent Versus Transient Response	139
Response with epistasis	140
Selection on autotetraploids	143
Ancestral Regressions	144
Response due to Environmental Correlations	147
Maternal Effects	149
Response Under Falconer's Dilution Model	150
Other Models of Maternal Effects	155
14. PRICE'S THEOREM: A GENERAL EQUATION FOR RESPONSE	159
Introduction of Price's Theorem	159
Derivation of Price's Theorem	162
Fisher's Fundamental and Robertson's Secondary Theorems of Natural Selection	163
Recovering the Breeders' Equation	165
Beyond the Breeders' Equation: Heywood's Decomposition	169
The Conditional Covariance $\sigma(w, z' z)$ and the Spurious response to Selection	170
Parent-Offspring Regressions Before and After Selection	172
Heywood's Decomposition of Response	173
15. SHORT-TERM CHANGES IN THE VARIANCE	179
Changes in Variance Due to Linkage Disequilibrium	179
Changes in Variance Under the Infinitesimal Model	181
Within- and between-family variance under the infinitesimal model	183
Accounting for inbreeding and drift	185
Change in Variance Under Truncation Selection	185
Changes in correlated traits	187
Directional Truncation Selection: Theory	188
Directional Truncation Selection: Experimental results	190
Effects of epistasis: Does the Griffing effect overpower the Bulmer effect?	190
Double Truncation Selection: Theory	191
Double Truncation Selection: Experimental Results	194
Response under Normalizing Selection	195
Selection with Assortative Mating	196
Results using the infinitesimal model	196
Assortative mating and enhanced response	197
Disruptive selection, assortative mating, and reproductive isolation	199
Selection in the Presence of Heritable Variation in σ_E^2	199
Micro-environmental variance, developmental noise and canalization	200
Evidence for heritable variation in the environmental variance	201
Modeling genetic variation in σ_E^2	202
$h_{v'}^2$, the heritability of the environmental variance	205
Translating the response in A_v into response in σ_E^2	206
Selection response in σ_E^2	207
16. LEAST SQUARES ANALYSIS OF SHORT-TERM SELECTION EXPERIMENTS	209
Variance in Short-term Response	209

Expected variance in response generated by drift	210
Variance in predicted response vs. variance in response	213
Realized Heritabilities	213
Estimators for several generations of selection	214
Weighted least-squares estimates of realized heritabilities	216
Standard Errors of Realized Heritability Estimates	217
Power: Estimation of h^2 from relatives or selection response?	218
Empirical vs. predicted standard errors	220
Realized Heritability With Rank Data	222
Infinitesimal-model corrections for disequilibrium	222
Experimental Evaluation of the Breeders' Equation	224
Most traits respond to selection	224
Sheridan's analysis	224
Realized heritabilities and selection intensity	226
Inbreeding and short-term response	227
Asymmetric selection response	228
Reversed response	231
Line Cross Analysis of Selection Experiments	232
Background	232
The Hammond-Gardner model	234
Extensions: inbreeding depression and drift	237
Control Populations and Experimental Designs	239
Basic theory of control populations	240
Divergent selection designs	241
Variance in response	242
Control populations and variance in response	243
Optimal Experimental Designs	243
Nicholas' criterion	244
Replicate lines	245

17. MIXED-MODEL AND BAYESIAN ANALYSIS OF

SELECTION EXPERIMENTS 251

Mixed model vs. Least Squares Analysis	251
Basics of Mixed-Model Analysis	252
REML estimation of unknown variance components	255
REML can (often) return variance estimates unbiased by selection	256
Animal-model Analysis of Selection Experiments	257
The basic animal model	257
Response is measured by change in mean breeding values	257
Model validation	261
Separating genetic and environmental trends	262
Validation that a trend is indeed genetic	264
Replicate lines	265
Estimating the additive variance at generation t	265
The Relationship Matrix \mathbf{A} Accounts for Drift and Disequilibrium	266
Modifications of the Basic Animal Model	268
Models with additional random effects	269
Common family and material effects	271
Treating certain breeding values as fixed effects	272

Dominance	273
Bayesian Mixed Model Analysis	275
Introduction to Bayesian statistics	275
Computiting posteriors and marginals: MCMC and the Gibbs sampler	279
Density estimation under MCMC	281
Bayesian analysis of the animal model	283
Application: Estimating Response in Pig Litter Size Components	284
LS, MM, or Bayes?	286
18. ENVIRONMENTAL EFFECTS AND	
THE RESPONSE IN NATURAL POPULATIONS	293
Response in Natural Populations: What is the Target of Selection?	294
Direct and Correlated Responses	294
Environmental correlations between fitness and traits	296
The Fisher-Price-Kirkpatrick-Arnold Model For Evolution Of Breeding Date In Birds	297
Modifying the Breeders' Equation for Natural Populations	300
Selection on Environmental vs. Genotypic Values	303
Rausher's Method	304
BLUP/REML estimates of breeding values	305
Obtaining the relationship matrix	306
Accuracy, reliability, and caveats with Using EBVs	308
Standarized vs. unstandarized gradients	311
Apparent Failures of Response in Natural Populations	312
Cryptic Evolution: Genetic Change Masked by Environmental Change	313
Tarsus Size in Collared Flycatchers	315
Antler Size in Red Deer	316
Changes in Heritability/Selection Over Environments	317
19. FAMILY-BASED SELECTION	101
Introduction to Family-Based Selection Schemes	102
Overview of the different types of family-based selection	102
Plant vs. animal breeding	103
Between- vs. within-family selection	104
Details of Family-Based Selection Schemes	104
Selection and Recombination Units	104
Variations of the Selection Unit	106
Variations on the Recombination Unit	107
Theory of Expected Single-Cycle Response	109
Modifications of the Breeders' equation for predicting	
family-based response	110
The selection unit-offspring covariance $\sigma(x, y)$	112
Variance of the selection unit $\sigma^2(x)$	115
Response for Particular Designs	119
Overview of between- and within-family selection	119
Between-family selection	120
Between-family selection: Which scheme is best?	123
Within-family selection	124
Realized Heritabilities	125
Accounting for Epistasis	126
Autotetraploids	128

Efficiency of Family-Based vs. Individual Selection	132
The Relative Accuracies of Family-based vs. Individual Selection	132
Comparing Selection Intensities: Finite Size Corrections	136
Response when Families are Replicated over Environments	137
Between-family variance under replication	137
Ear-to-Row Selection	140
Modified Ear-to-Row Selection	140
Selection on a Family Index	143
Response to Selection on a Family Index	144
Lush's Optimal Index	145
Correcting the Selection Intensity for Correlated Variables	148
20. SELECTION UNDER INBREEDING	293
Basic Issues in Response Under Inbreeding	293
Accounting for inbreeding depression	294
Response under small amounts of inbreeding	294
Using ancestral regressions to predict response	295
The covariance between inbred relatives	296
Limitations	299
Family Selection with Inbreeding and Random Mating	299
Family selection using inbred parents	300
Progeny testing using inbred offspring	302
S_1 , S_2 , and $S_{i,j}$ family selection	303
Cycles of inbreeding and outcrossing	309
Individual Selection Under Pure Selfing	311
Response under pure selfing	312
Response when inbreeding pure lines	315
The Bulmer effect under selfing	316
Family Selection Under Pure Selfing	318
Covariance between relatives in a structured selfing population	319
Response to family selection	324
Within-family selection under selfing	326
Combined Selection	327
Partial Selfing	330
An approximate treatment using covariances	330
A more careful treatment: Kelly's Structured Linear Models	333
21. ASSOCIATIVE EFFECTS: COMPETITION, SOCIAL INTERACTIONS,	
GROUP AND KIN SELECTION	157
Direct Versus Associative Effects	158
Early models of competition	159
Direct and associative effects	159
Animal well-being and the improvement of the heritable social environment	161
What do we mean by group?	161
Trait- versus variance component-based models	162
The total breeding value (TBV) and T^2	162
A_s as a function of group size	166
Selection Under the Presence of Associative Effects	167
Individual selection: Theory	167
Individual selection: Direct vs. social response	169

Individual selection: Maternal effects 171

Group selection: Theory 171

Group selection: Direct vs. social response 175

Group selection: Experimental evidence 175

Incorporating Both Individual and Group Information 177

 Response on a weighted index 177

 Optimal response 181

BLUP Estimation of Direct and Associate Effects 183

 Mixed-model estimation of direct and associative effects 184

 Muir’s experiment: BLUP selection for Quail weight 188

 Details: Environmental group effects and the covariance structure of \mathbf{e} 189

 Details: Ignoring additive social values introduces bias 192

 Details: Identifiability of variance components 192

 Final Thoughts: Appropriate designs for estimating direct and associative effects . 194

Associative Effects, Inclusive Fitness, and Fisher’s Theorem 194

 Change in mean fitness when associative effects are present 194

 Inclusive fitness 197

 Bijma’s theorem: inclusive fitness and Fisher’s fundamental theorem 199

Hamilton’s rule 200

 How general is Hamilton’s rule? 200

 Queller’s generalization of Hamilton’s rule 202

Group Selection, Kin Selection, and Associative Effects 202

 Kin, group, and multilevel selection 202

 Mucho ado about nothing? 203

 Group and kin selection: Models without associative effects 204

 Group and kin selection in the associative effects framework 208

 Closing comments 210

IV. POPULATION-GENETIC MODELS OF TRAIT RESPONSE 3

22. THE INFINITESIMAL MODEL AND ITS EXTENSIONS 100

The Infinitesimal Model 101

 Allele frequencies do not change under the infinitesimal model 101

 Disequilibrium under the infinitesimal model 102

 Dominance 102

 Gaussian features of the infinitesimal 103

 Not all limits are Gaussian 103

 Modifications of the infinitesimal model 104

Gaussian Continuum-Of-Alleles Models 104

 Infinite alleles and continuum-of-alleles models 104

 Drift 105

 Drift and a finite number of loci 107

 Effective number of loci, n_e 108

 Dynamics: σ_a^2 and d change on different time scales 109

 Response in stabilizing selection experiments: selection or drift? 110

 How robust is the continuum-of-alleles model? 110

The Bulmer Effect Under Linkage 111

 An approximate treatment 111

A more careful treatment	114
Response Under Non-Gaussian Distributions	116
Describing the genotypic distribution: Moments	116
Describing the genotypic distribution: Cumulants and Gram-Charlier series	119
Application: Departure from normality under truncation selection	121
Short-term response ignoring linkage disequilibrium	124
Short-term response ignoring allele frequency change	128
Summary: Where Does All This Modeling Leave Us?	130
23. LONG-TERM RESPONSE: DETERMINISTIC ASPECTS	134
Idealized Long-term Response in a Large Population	258
Deterministic Single-locus Theory	261
Lande's model: a major gene in an infinitesimal background	266
Are major genes or polygenes more important for long-term response?	269
An Overview of Long-term Selection Experiments	271
Estimating selection limits and half-lives	271
General features of long-term selection experiments	272
Increases in variances and accelerated responses	275
Linkage effects	278
Conflicts Between Natural and Artificial Selection	281
Accumulation of lethals in selected lines	283
Expected equilibrium frequency of recessive lethals	283
Lerner's model of genetic homoestasis	287
Characterizing the Nature of Selection Limits	288
24. LONG-TERM RESPONSE: FINITE POPULATIONS	291
Population Genetics of Selection and Drift	292
Drift and selection at a single locus	292
Fixation probabilities for alleles at QTL	295
Expected allele frequency in a particular generation	296
The Cohan effect: increased divergence under uniform selection	297
Results for two loci: the Hill-Robertson effect	299
The Effect of Selection on Effective Population Size	302
The expected reduction in N_e from directional selection	303
Molecular variation is reduced in regions of low recombination	307
Drift and Long-term Selection Response	308
Basic theory	309
Robertson's theory of selection limits	311
Tests of Robertson's theory of selection limits	313
Weber's selection experiments on <i>Drosophila</i> flight speed	317
The Effects of Linkage on the Selection Limit	319
Optimal Selection Intensities for Maximizing Long-term Response	323
Effects of Population Structure on Long-Term Response	326
Founder effects and population bottlenecks	326
Population subdivision	330
Within-family selection	333
Asymptotic Response due to Mutational Input	335
Results for the infinitesimal model	336
Expected asymptotic response under more general conditions	339
Optimizing Asymptotic Selection Response	342

25. MAINTENANCE OF QUANTITATIVE GENETIC VARIABILITY	346
Introduction: The nature of within-population variation	xxx
One-locus theory	xxx
Mutation-Drift equilibrium	xxx
Mutation-selection equilibrium	xxx
Neutralist-Selectionist debate for Molecular Variation	xxx
Estimating N_e from molecular data	xxx
Equilibrium Variances under Directional Selection	xxx
Estimation of σ_m^2 from Selection Experiments	xxx
López-Fanjul's Selection Experiment on <i>Drosophila</i> Bristle Number	xxx
Optimizing selection	xxx
Genetic variation in the absence of mutation	xxx
Mutation-selection equilibrium Models under Optimizing Selection	xxx
Kimura's Model	xxx
Lande's Model	xxx
Bulmer's model	xxx
House of cards vs. continuum of allele models	xxx
What forces maintain quantitative-genetic variation?	xxx
 V. MEASURING SELECTION	 3
 26. INDIVIDUAL FITNESS AND THE MEASUREMENT OF UNIVARIATE SELECTION	 301
Episodes of Selection and the Assignment of Fitness	301
Fitness components	302
Assigning fitness components	303
Potential issues with assigning discrete fitness values	305
Assigning components of offspring fitness to their mothers	305
Concurrent episodes, reproductive timing and individual fitness λ_{ind}	307
Variance in Individual Fitness	310
Partitioning I across episodes of selection	312
Correcting lifetime reproductive success for random offspring mortality	313
Variance in mating success: Bateman's principles	314
Some caveats in using opportunity of selection	314
Descriptions of Phenotypic Selection: Introductory Remarks	316
Fitness surfaces	317
Descriptions of Phenotypic Selection: Changes in Phenotypic Moments	319
Directional selection	319
Quadratic selection	319
Gradients describe the local geometry of the fitness surface	321
Gradients appear in selection response equations	321
Partitioning changes in means and variances into episodes of selection	322
Choice of the reference population: "independent partitioning"	323
Standard errors for estimates of differentials and gradients	324
Descriptions of Phenotypic Selection: Individual Fitness Surfaces	325
Linear and quadratic approximations of $W(z)$	326
Hypothesis testing and approximate confidence intervals	329
Power	331
Quadratic surfaces can be very misleading	331

Fitting other parameteric fitness functions	332
Nonparametric approachers: Schluter’s cubic-spline estimate	333
The importance of experimental manipulation	334
27. MEASURING MULTIVARIATE SELECTION	370
Selection on Multivariate Phenotypes: Differentials and Gradients	370
Changes in the mean vector: the directional selection differential S	371
The directional selection gradient β	372
Directional gradients, fitness surface geometry and selection response	374
Changes in the covariance matrix: the quadratic selection differential C	375
The quadratic selection gradient γ	376
Quadratic gradients, fitness surface geometry and selection response	378
Fitness surface curvature and within-generation changes in variances and covariances	379
Multivariate Quadratic Fitness Regressions	380
Estimation, hypothesis testing and confidence intervals	380
Regression packages and coefficients of γ	382
Geometric aspects	382
A brief digression: orthonormal and diagonalized matrices	383
Canonical transformation of γ	384
Are traits based on canonical axes “real”?	387
Strength of selection: γ_{ii} versus λ	388
Significance and confidence regions for a stationary point	388
Multivariate Nonparametric Fitness Surface Estimation	389
Projection pursuit regression	389
Thin-plate splines	390
Strenght of Selection in Natural Populations	391
Kingsolver’s meta-analysis	392
Directional selection: strong or weak?	393
Quadratic selection: strong or weak?	396
Directional selection on body size and Cope’s law	397
Unmeasured Characters and Other Biological Caveats	397
Path Analysis and Fitness Estimation	399
Levels of Selection	402
Contextual analysis	402
Selection can be anatagonistic across levels	404
Group selection is likely density-dependent	404
Selection differentials can be misleading in levels of selection	405
Hard, soft, and group selection: A contextual analysis viewpoint	406

VI. SELECTION ON MULTIPLE CHARACTERS 3

28. MULTIVARIATE RESPONSE: CHANGES IN MEANS	1
The Multivariate Breeders Equation	1
Overview of key features and concepts	1
Derivation of the multivariate breeders equation	4
The multivariate secondary theorem of natural selection	7
Response when the parent-offspring regression is multivariate linear	8
Bivariate Selection	9

Correlated response to selection	10
Indirect selection may give a larger response than direct selection	12
Realized genetic correlations	13
General bivariate selection	15
Realized genetic correlations with bivariate selection	17
Asymmetric correlated responses are frequently seen	18
Comparison of Multivariate Responses	18
Standardization of response	19
Mean standardization and evolvability	21
Realized selection gradients	21
Evolutionary Constraints Imposed by Genetic Correlations	25
Dynamics of quantitative traits on an adaptive topography	26
What happens to mean fitness \bar{W} ?	27
Constraints are given by the eigenstructure of \mathbf{G}	27
Trade-offs, developmental constraints, genetic correlations, and the Lande equation	30
Multivariate measures of evolvability	32
Schluter's genetic line of least resistance, g_{\max}	33
Is there genetic variation in the direction of response?	36
Blow's matrix subspace projection	37
Conditional genetic variance and conditional evolvability	39
29. MULTIVARIATE RESPONSE: CHANGES IN COVARIANCES	1
Changes in \mathbf{G} Under the Infinitesimal Model	1
The dynamics of the disequilibrium matrix \mathbf{D}	2
The proportional change model for $\Delta\mathbf{P}$	3
Within-generation changes \mathbf{G} due to selection on variances and covariances	5
Asymmetric correlated responses occurs under the infinitesimal model	6
Response in \mathbf{G} under a multivariate Gaussian fitness function	8
Allele Frequency Changes and Instability of Genetic Covariances	11
Pleiotropic-based genetic correlations may become more negative over time	12
Genetic covariances are more fragile than genetic variances	12
It is difficult for antagonistic pleiotropy to maintain variation	13
Hidden Pleiotropy: A zero genetic covariance can still harbor many pleiotropic alleles	15
Experimental Studies of the Response to Selection to Change Covariances	16
Genetic Models of Covariances	19
Resource partitioning models: background	19
James' analysis of changes in covariances under resource partitioning models	19
Tradeoffs can lead to positive, as well as negative, covariances	21
Björklund's analysis	22
Optimization models, Functional Constraints, and \mathbf{G}	23
Long-Term Directional Selection	26
The infinitesimal model with drift	27
The infinitesimal model with drift and mutation	28
The balance between directional and stabilizing selection: infinitesimal model results	29
Long-term response is a function of the distribution of allelic effects	30
The balance between directional and stabilizing selection: Finite locus models	31
Long-term Quadartic Selection	32
Lande's multivariate model of pleiotropic mutation-selection balance	33
γ and \mathbf{G}	34
Model assumptions, genetic correlations, and hidden pleiotropy	35

Stability of \mathbf{G}	36
30. COMPARISONS OF \mathbf{G} AND ITS STABILITY	1
Changes in \mathbf{G} Under Drift	1
Under additivity, \mathbf{G} shows an expected proportional decrease	1
The experimental results of Phillips, Whitlock, and Fowler	2
Changes in \mathbf{G} when non-additive genetic variance is present	5
The eigenstructure of \mathbf{G} under drift and mutation	6
Comparing Covariance Matrices: Methodology	7
General issues of inference on \mathbf{G} using a population sample	8
Identity, proportionality, common orientation, common scaling	9
Element-by-element tests	11
Roff's jackknife MANOVA approach	12
Roff's T test	13
Mantel's test and other matrix correlation approaches	14
Regression methods: tests of proportionality	15
Likelihood-based tests assuming multivariate normality: variance components	16
Likelihood-based tests assuming multivariate normality: Bertlett's modified test ..	17
Random skewers: probing the geometry of \mathbf{G} with responses to selection response	18
Comparison of shared geometry: the Flury hierarchy	19
Comparison of shared geometry: Krzanowski subspace comparison	24
Still no ideal solution	25
Comparing Covariance Matrices: Data	25
Conclusions	28
Estimating the Dimension of a Covariance Matrix	28
Leading eigenvalues are overestimated, smaller eigenvalues underestimated	29
Problems with bootstrap-based confidence intervals for eigenvalues and rank	30
Canonical decomposition of the estimated covariance matrix	32
Amemiya's rank test	33
Reduced Rank estimates of \mathbf{G}	34
Factor-analytic approaches for building reduced-rank estimates	35
Dimensionality of \mathbf{G} : data	37
Eigenvalue-based measures of effective dimensionality	38
31. THEORY OF INDEX SELECTION	400
General Theory Selection on a Linear Index	400
Genetic variance, heritability, and response of an index	400
Response in the individual components of the index	402
The retrospective index	403
The selection and response indices may contain different traits	404
Changes in the additive variance of I due to index selection	405
Changes in \mathbf{G} and \mathbf{P} under index selection	406
Optimizing the Expected Response of a Linear Index	408
The index of selection usually does not equal the index of response	408
Selection and response indices with non-overlapping traits	409
The Smith-Hazel index	411
Properties of the Smith-Hazel Index	412
Other useful results for the Smith-Hazel index	414
Estimated, base, and Elston indices	414
The Hayes-Hill transformation: detecting flaws in the estimated index	418

“Bending” and “rounding” corrections of the estimated index	419
Constraints on R and S given a specified selection intensity	420
Restricted and Desired-gains Indices	421
Restricted indicies	421
Desired-gains indicies	423
Summary of Linear Selection Indices	426
Nonlinear Selection Indices	427
Specific issues with nonlinear indices	427
Quadratic indices	428
Linear indices for nonlinear merit	431
Exact optimization of nonlinear indices	433
Optimal weights depend on the length of the experiment	433
Sequential Approaches: Tandem Selection and Independent Culling	434
Tandem selection	434
Independent culling	435
Selection of extremes	437
Relative Efficiencies of Index Selection, Independent Culling, and Tandem Selection	438
Theory	438
Data	440
Multistage Selection	441
Optimal values for multistage cullings	441
Cotterill and James’ approximately optimal two-stage selection	442
Multistage index selection	443
Xu and Muir’s method of transformed culling and orthogonal index selection	443
32. APPLICATIONS OF INDEX AND MULTIPLE-TRAIT SELECTION	455
Improving the Response of a Single Character Using a Selection Index	455
General theory	456
More detailed analysis of two special cases	458
Repeated measures of a character	460
Using Information From Relatives	461
General Theory	461
Information from a single relative	462
Constructing selection indices when the individual itself is not measured	463
Within and Between Family Selection	465
Lush’s index	466
Osborne’s index	470
Selection on a Ratio	471
Approximate linear indices for ratio selection	472
Other linear-based indicies for ratio selection	474
Which method is best?	474
Selection directly on a ratio: selection differentials and response	475
Selection and Sexual Dimorphic Traits	479
Components of the genotype \times sex interaction variance	480
Selection in sex-limited traits	480
Differential selection across the sexes	480
Sex-specific transmission differences	481
The joint response for a single dimorphic trait	481

Response with sex-linkage	485
Sexual dimorphism: a correlated or direct response?	486
Sexual dimorphism in size: Rensch's rule	487
Selection on a vector of sexually dimorphic traits	488
Selection of the Environmental Variance σ_E^2	490
The bivariate Mulder-Bijima-Hill Model: Estimation	490
The bivariate Mulder-Bijima-Hill Model: Response in σ_E^2	490
Extensions of the Mulder-Bijima-Hill Model: Accounting for skew	490
Extensions of the Mulder-Bijima-Hill Model: Family and Sire-selection	490
Changes in the genetic variances and covariance for A_m, A_v	490
33. SELECTION AND G X E: INTRODUCTION	455
Selection and G x E: Basic Ideas	456
G X E is both a challenge and an opportunity	456
Components of $\sigma_{G \times E}^2$: Variance heterogeneity and lack of correlations	457
G x E is context-specific	458
Response in Two Environments	458
Response in a target environment: Hammond's conjecture	459
Improving an index of mean performance	461
Sensitivity and the Jinks-Connolly rule	463
Selecting in Two Environments	466
The cost to response from G x E	466
Selecting a group over several environments	466
Selection for mean performance versus sensitivity	468
Selecting in Multiple Environments	471
MET: Multiple-environment trials	471
Design trade-offs: years versus location	474
Design trade-offs: subdividing a target region	476
Participatory breeding and G x E	476
34. SELECTION AND G X E: ADVANCED TOPICS	483
Laying the Foundation: The Basic Model for G x E	484
Measuring and Selecting for Stability	485
Static vs. dynamic stability	485
Measuring stability: Finlay-Wilkinson regressions	486
Splitting the regression: The Varma-Chahal modification	488
Mean performance versus stability: insights from Finlay-Wilkinson regressions	489
Location-based modifications of the Finlay-Wilkinson regression	490
Finlay-Wilkinson regressions and Types 1 through 4 stability	490
Univariate measures of stability	492
Repeatability and breeding for stability	495
Joint selection for stability and performance	497
Probability criteria for selection: Risk aversion and safety-first	499
Seeking Structure in G x E: AMMI, The SVD, and Biplots	500
The singular-value decomposition (SVD)	501
AMMI models	504
Modifications of the basic AMMI family of models	506
Using AMMI to predict cell means	506
Visualization of Interactions: Biplots	508
GGE/GGL Biplots	512

GGE vs. AMMI Biplots 515

Seeking Structure in $G \times E$: Incorporating Environmental Factors 516

 Factorial regressions 517

 Reduced rank factorial regressions 518

Mixed-Model Analysis of $G \times E$ 520

 BLUP estimates under compound symmetry assumptions 522

 Structured covariance models: Introduction 526

 Structured covariance models: Finlay-Wilkinson regressions 526

 Structured covariance models: AMMI 528

Putting It All Together 529

 Structured covariance matrices and stability measures 530

 Structured covariance matrices and selection response 531

VII. APPENDICES **xxx**

A1. DIFFUSION THEORY **1**

 Foundations of Diffusion Theory 1

 The Infinitesimal Mean $m(x)$ and Variance $v(x)$ 2

 The Kolmogorov Forward Equation and its Solutions 2

 Boundary Behavior of a Diffusion 4

 Derivation of The Kolmogorov Forward Equation 4

 Stationary Distributions 5

 The Kolmogorov Backward Equation 7

 Applications in Population Genetic 7

 Probability of Fixation 8

 Time to Fixation 10

 Expectations of More General Functions 12

 Multivariate Diffusions: Multiple Alleles and Two Loci 13

 Applications in Quantitative Genetics 14

 Brownian Motion Models 14

 Ornstein-Uhlenbeck Models 16

 Stationary Distributions for Mean Phenotype 17

A2. INTRODUCTION TO BAYESIAN STATISTICS **21**

 Bayes' theorem 21

 From Likelihood to Bayesian Analysis 23

 Marginal Posterior Distributions 24

 Summarizing the Posterior Distribution 24

 Highest Density Regions (HDRs) 25

 Bayes Factors and Hypothesis Testing 25

 The Choice of a Prior 27

 Diffuse Priors 28

 Sufficient Statistics and Data-transformed likelihoods 28

 The Jeffreys' Prior 29

 Posterior Distributions Under Normality Assumptions 31

 Known Variance and Unknown Mean 31

 Gamma, Inverse-Gamma, χ^2 and χ^{-2} distributions 33

 Unknown Variance, Inverse- χ^2 priors 34

 General case: unknown mean and variance 35

Conjugate Priors	35
The Beta and Dirichlet Distributions	36
Wishart and Inverse-Wishart Distributions	36
Conjugate Priors for the Exponential Family of Distributions	37
A3. MCMC METHODS AND BAYESIAN ANALYSIS	39
Monte Carlo Integration	39
Importance Sampling	40
Introduction to Markov Chains	40
The Metropolis-Hastings Algorithm	43
Metropolis-Hasting Sampling as a Markov Chain	45
Burning-in the Sampler	46
Simulated Annealing	47
Choosing a Jumping (Proposal) Distribution	48
Convergence Diagnostics	49
Autocorrelation and Sample Size Inflation	49
Tests for Convergence	50
One Long Chain or Many Smaller Chains?	51
The Gibbs Sampler	51
Using the Gibbs Sampler to Approximate Marginal Distributions	53
The Monte Carlo Variance of a Gibbs-Sampled Based Estimate	54
Convergence Diagnostics	55
A4. THE GEOMETRY OF VECTORS AND MATRICES:	
EIGENVALUES AND EIGENVECTORS	59
The Geometry of Vectors and Matrices	59
Comparing vectors: lengths and angles	59
Matrices describe vector transformations	61
Orthonormal matrices	62
Eigenvalues and eigenvectors	63
Properties of symmetric matrices	65
Correlations can be removed by a matrix transformation	67
Canonical axes of quadratic forms	68
Implications for the multivariate normal distribution	70
Principal components of the variance-covariance matrix	71
Testing for Multivariate Normality	73
Graphical tests: Chi-square plots	73
Mardina's test: Multivariate skewness and kurtosis	75
A5. DERIVATIVES OF VECTORS AND VECTOR-VALUED FUNCTIONS	79
Derivatives of Vectors and Vector-valued Functions	79
The Hessian matrix, local maxima/minima, and multidimensional Taylor series	83
Optimization under constraints	86
A6. MULTIPLE COMPARISONS: BONFERRONI CORRECTIONS AND FALSE DISCOVERY RATES	89
General Tools for Multiple Comparisons	89
How many false positives?	89

Fisher’s method of combining p values over independent tests	90
Schweder-Spjøtvoll plots	90
Bonferroni Corrections	91
Sequential Bonferroni Corrections	92
Holm’s method	92
Simes-Hochberg method	92
Hommel’s method	93
FDR: The False Discovery Rate	94
Morton’s Posterior Error Rate (PER) and the FDR	95
A technical aside: different definitions of false discovery rate	97
The original Benjamini-Hochberg FDR estimator	98
A (slightly more) formal derivation of the estimated FDR	99
Estimating the number of null hypotheses, n_0	99
Storey’s q value	100
