

Contents

- I. Introduction
- II. Let's Get Small: Response Under the Infinitesimal Model
 - A. Basic Structure of the Infinitesimal Model
 - B. Gametic Phase Disequilibrium and the Additive Genetic Variance
 - C. The Bulmer Effect: Disequilibrium-Induced Changes in the Variances
 - D. The Dynamics of d Under Truncation Selection
 - E. Within and Between-Family Contributions to Additive Genetic Variance
- III. Modifications of the Basic Infinitesimal Model
 - A. Drift and the Infinitesimal Model
 - B. Robertson's Theory of Selection Limits Under Drift
 - C. Joint Treatment of Drift and Disequilibrium
 - D. The Expected Reduction in N_e from Directional Selection
 - E. Test's of Robertson's Model
 - F. Gaussian Approximations Allowing for a Finite Number of Loci
- IV. Strictly Deterministic Models of Response
 - A. Single-locus Models
 - B. Single-locus Deterministic Limits
 - C. Allele Frequency Change Required for Partial Response
- V. Selection On A Quantitative Trait Locus
 - A. Selection Coefficients on a QTL
 - B. Half-Life of Deterministic Response
 - C. Increases in Variance and Accelerated Responses
- VI. Single-Locus Models In Finite Populations
 - A. Fixation Probabilities of Favorable QTL Alleles
 - B. Limits Under Drift and Selection
 - C. Variance In Response
- VII. Response From Mutational Input
 - A. Contribution from New Mutation
 - B. Mutational Response Under the Infinitesimal Model
- VIII. The Illinois Long-term Experiment: Which Models Fit?
 - A. Effective Population Sizes of the Illinois Lines
 - B. Strictly Deterministic Predictions

C Does Selection on QTLs Overpower Drift?

D We Can We Conclude?
